

EMTH211 Tutorial 12 Problems

Attempt the following problems before the tutorial and show your work to your tutor.

Problem 1

Consider the simple linear regression model

$$\mathbf{y} = b_0 + b_1\mathbf{x} + \mathbf{e}.$$

with data vectors $\mathbf{x} = (1, 2, 3, 4)^\top$ and $\mathbf{y} = (1, 2, 3, 8)^\top$. Compute (without using Matlab)

- (i) the OLS estimators \hat{b}_0 and \hat{b}_1 .
- (ii) the R^2 of the regression.
- (iii) the 95% confidence interval for b_1 based on the estimator \hat{b}_1 .

Problem 2

Consider the simple linear regression model

$$\mathbf{y} = b_0 + b_1\mathbf{x} + \mathbf{e}.$$

Check that

- (i) the mean of the fitted values $\bar{\hat{\mathbf{y}}}$ equals the mean of the dependent variable $\bar{\mathbf{y}}$.
- (ii) SSE equals $\|\hat{b}_1\tilde{\mathbf{x}}\|^2$.

In-tutorial problems

Problem 3

Define an interval for a regression slope b_1 as follows. Generate a random number u between 0 and 1. If $u < 0.95$, take the interval $(-\infty, \infty)$. Otherwise take the empty interval. Explain why this is a 95% confidence interval for b_1 .

Problem 4 (Matlab)

The data in the table below show the effect of reaction temperature on molecular weight in the production of a class of plastic material. The data consist of 8 measurements each of

two variables: \mathbf{x} being the reaction temperature (in °C) and \mathbf{y} being the average molecular weight. Consider the linear regression

$$\mathbf{y} = b_0 + b_1\mathbf{x} + \mathbf{e}.$$

Compute with Matlab

- (i) the OLS estimators \hat{b}_0 and \hat{b}_1 .
- (ii) Plot the data and the regression line in the same figure.
- (iii) the goodness of fit coefficient R^2 .
- (iv) the 95% confidence interval for b_1 based on \hat{b}_1 .

Reaction Temp (°C)	Average molecular weight
165	800
178	905
188	1185
207	1520
220	2078
235	2423
251	2657
260	2901
